## Slides for my talk on “Automating X11 Keystrokes”

[X11](#) is the graphical user interface most widely used on Linux operating systems. My [slides](#) and [video demo](#) for a short talk given at the [Philadelphia area Linux Users Group](#) (PLUG) on March 2nd are on-line. The slides briefly cover xrandr (which can also be used to set the screen resolution), xset, xwd / xwud, xdotool, and xautomation including xte. You can get the slides and watch the video at [my page on Automating X11 Keystrokes](#).
